

Criterion	 Excellent	 Successful	 Revise
Methods		Organized using appropriate subheadings.	
Methods: Participants		Describes the sample that was studied. How many people? How were they recruited? Note any exclusion criteria or special arrangements.	
Methods: Stimuli	Stimuli, task, and/or procedures are illustrated in an appropriate figure.	Describes the stimuli in as much detail as a reader would need to reproduce your experiment. How did you create or select them? Why did you make those choices?	
Methods: Task		Explains the core cognitive judgment or decision that participants made. Most cognitive psychology experiments center around one or more tasks. This section should also describe how any task-derived dependent variables are measured. The Task section is often grouped with the Stimuli and/or the Procedures into a single subsection.	
Methods: Procedures		Gives a step-by-step narrative of what a participant experienced in your study. What other measurements or questionnaires did they complete? How many trials of your task, and how were they organized? How long did the experiment take?	
Results	For each research question, presents the key comparison that allows researchers to distinguish among possible alternative answers.	Organized with one paragraph for each outcome variable and/or research question.	
Results: Descriptive statistics		A central tendency and spread is reported for each outcome. When a predictor variable is categorical, descriptives are reported for each relevant condition.	

Criterion	 Excellent	 Successful	 Revise
Results: Inferential statistics		Inferential statistics are appropriate to the data and the research question, computed correctly, and reported in APA style.	
Results: Figure(s)	For each research question, the key comparison is illustrated in <u>one</u> polished, readable figure with clearly written labels and captions.	Data are shown in one or more figures with appropriate labels and captions.	
Writing: structure and flow		Organized and easy to follow, with headings and subheadings as appropriate.	
Writing: Mechanics	Almost no spelling / grammar / mechanics errors (fewer than 1 per page)	Minimal spelling / grammar / mechanics errors (fewer than 2 per page).	
Writing: APA style		Minimal APA style errors (fewer than 5).	
Formatting		Includes written report, R markdown, and compiled R analysis in appropriate file formats.	
Analyses and code	Use “plain English” commentary surrounding your analysis code to explain your overarching goal, what each code block does, and what the output means. Use highly readable code with meaningful variable names and consistent use of whitespace.	Uses executable code blocks in an R Markdown document to load, process, and analyze the raw data. Statistical procedures are correct. Code runs.
